## top 10 top cybersecurity threats

### **vulnerabilities:**

newly discovered critical vulnerabilities in microsoft exchange and advances in phishing create new areas for msp's to monitor.

### **Commitment corporate email:**

when a cybercriminal gains access to a corporate email, they can use it to send phishing, steal confidential information or use the account to launch attacks.

### **crime-as-a-service:**

this describes the provision of cybercriminal tools, services and expertise through an underground, illicit market.

### **supply chain attacks:**

Hackers infiltrate supply chain technology to access source code, builds, and other infrastructure components of benign software applications.

### **cloud-based attacks:**

With so many companies using the cloud and cloud networks becoming more complex, your infrastructure has become an easy target for digital threat actors.

### **data center attacks:**

these malicious activities are aimed at compromising the security of data centers, facilities that house computer systems, and other critical infrastructure.

### **ransomware:**

this form of cyber attack has been around for decades, and hackers continue to develop and evolve their methods.

### **iot device hacking:**

with many employees accessing sensitive company platforms and data from multiple dispersed endpoints, hackers have more opportunities for infiltration.

### **internal threats:**

once internal system users are compromised, they can become an even greater threat to the system than external attackers.

### **State-sponsored cyber warfare:**

cyberattacks by one nation-state against another for strategic or military purposes, often carried out by well-funded companies and highly skilled teams of hackers or cyber soldiers.

apt115 ac3r014

# ac3r0l4timeline

# modus operandi

- social engineering kit

- vulnerability exploit kit (0days), e.g. 0daytoday

- buying company access to forums

- Private virtual private servers from countries like (Iran, Venezuela, Panama and Switzerland)

- vpn (airvpn, alerdium and mullvad) and tor (whonix or tails)

- shared command and control server (cobalt strike)

- polymorphic ransomware + sophisticated ttps

- bitcoin, monero and ethereum wallets

- invasions + theft and kidnapping of data in fortune 1000 companies

tactics, techniques and procedures (ttps)

## mitre att&ck and ttps

*“att&ck mitre is a framework that maps cyber adversary tactics and techniques to help defend and understand cybersecurity threats.”*

ttps (tactics, techniques and procedures) are a set of specific strategies and actions used by adversary actors to carry out cyber attacks, being important for understanding and defending against these threats.

## mitre att&ck and ttps

to the **tactics** are the tactical objectives that a threat can use during an operation.

to the **techniques** describe the actions that threats take to achieve their goals.

You **procedures** are the technical steps required to perform the action.

Tactic {

Initial Access	Execution	Persistence	Privilege Escalation	Defense Evasion	Credential Access	Discovery	Lateral Movement	Collection	Exfiltration	Command and Control
Drive-by Compromise	AppleScript	.bash_profile and .bashrc	Access Token Manipulation	Access Token Manipulation	Account Manipulation	Account Discovery	AppleScript	Audio Capture	Automated Exfiltration	Commonly Used Port
Exploit Public-Facing Application	CMSTP	Accessibility Features	Accessibility Features	BITS Jobs	Bash History	Application Window Discovery	Application Deployment Software	Automated Collection	Data Compressed	Communication Through Removable Media
Hardware Additions	Command-Line Interface	AppCert DLLs	AppCert DLLs	Binary Padding	Brute Force	Browser Bookmark	Distributed Component	Clipboard Data	Data Encrypted	Connection Proxy
Replication Through Removable Media	Control Panel Items	AppInIt DLLs	AppInIt DLLs	Bygones	Account				Data Transfer Size Limits	Custom Command and Control

**Drive-by Compromise**

A drive-by compromise is when an adversary gains access to a system through a user visiting a website over the normal course of browsing. With this technique, the user's web browser is targeted for exploitation. This can happen in several ways, but there are a few main components:

Multiple ways of delivering exploit code to a browser exist, including:

- A legitimate website is compromised where adversaries have injected some form of malicious code such as JavaScript, iFrames, cross-site scripting.
- Malicious ads are paid for and served through legitimate ad providers.
- Built-in web application interfaces are leveraged for the insertion of any other kind of object that can be used to display web content or contain a script that executes on the visiting client (e.g. forum posts, comments, and other user controllable web content).

Often the website used by an adversary is one visited by a specific community, such as government, a particular industry, or region, where the goal is to compromise a specific user or set of users based on a shared interest. This kind of targeted attack is referred to a strategic web compromise or watering hole attack. There are several known examples of this occurring.<sup>[1]</sup>

Drive-by Compromise Technique	
ID	T1189
Tactic	Initial Access
Platform	Linux, Windows, macOS
Permissions Required	User
Data Sources	Packet capture, Network device logs, Process use of network, Web proxy, Network intrusion detection system, SSL/TLS inspection

### elevatekit

privilege escalation kit for  
cobalt strike

### mimikatz

extract sensitive information  
such as clear text passwords and  
password hashes

```
[~]$ persistence.bat --help
```

```
persistence
```

```
    refers to the point at which the opposing team gains continued access  
    to a compromised system
```

```
creation and modification of processes
```

```
create accounts on the machine
```

```
create scheduled tasks
```

```
rootkits (ring 3)
```

# persistence

## sharpersist

toolkit for persistence  
<https://github.com/mandiant/sharpersist>

## schedulerrunner

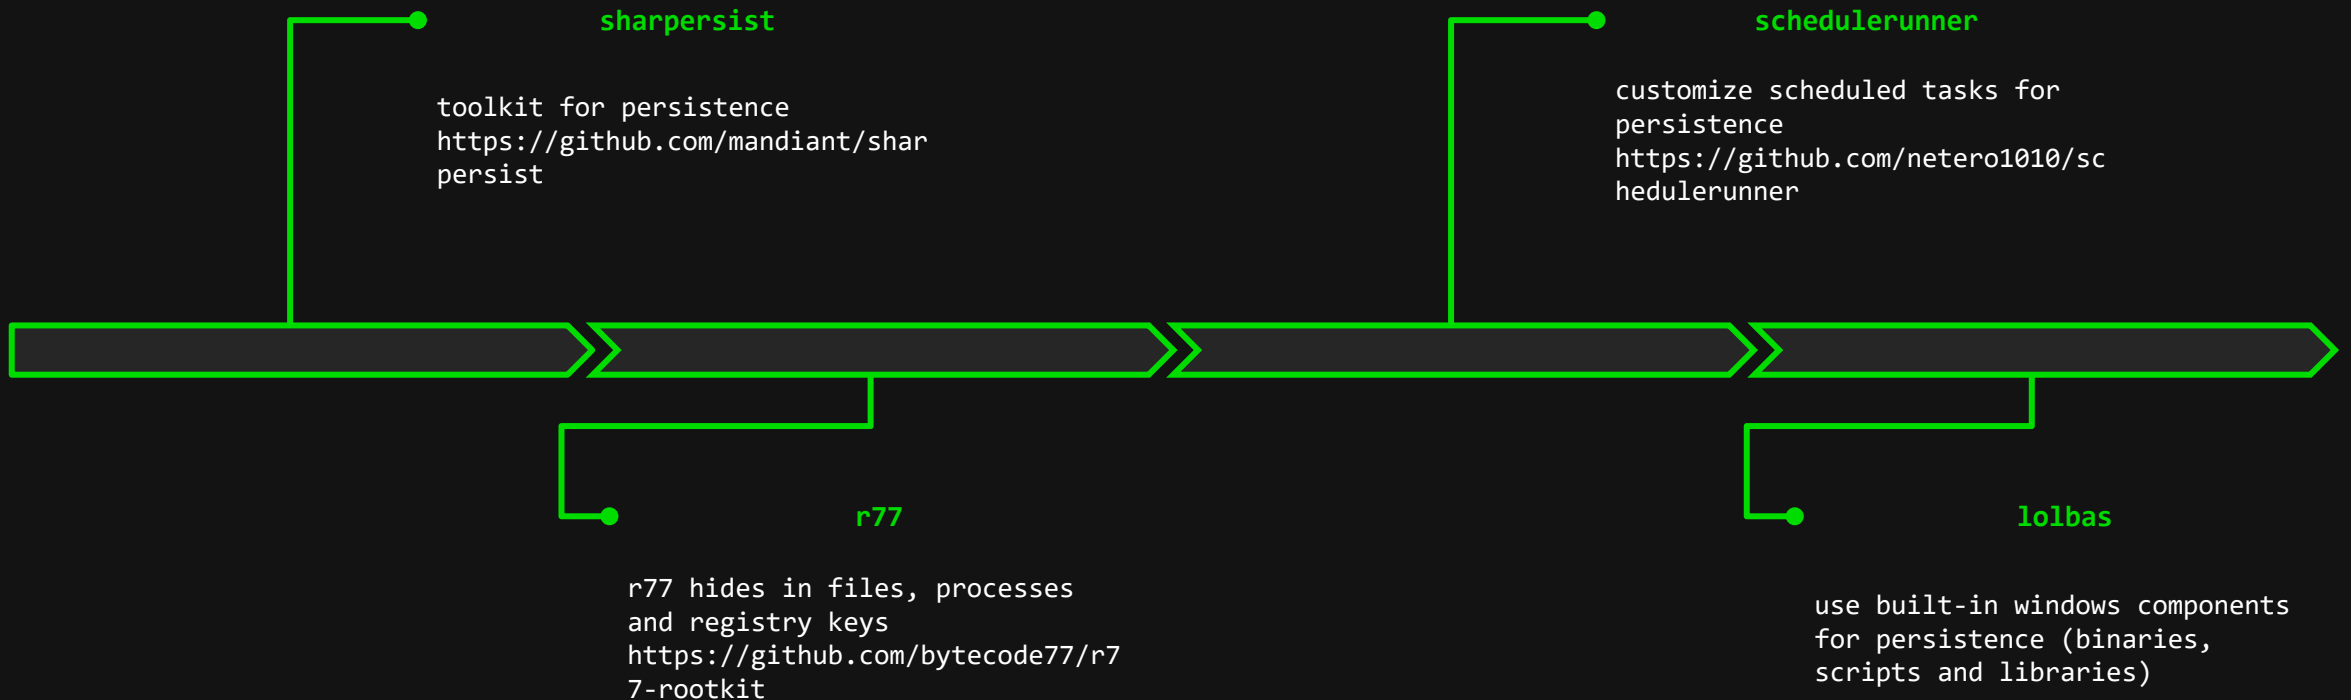

customize scheduled tasks for persistence  
<https://github.com/netero1010/schedulerrunner>

## r77

r77 hides in files, processes and registry keys  
<https://github.com/bytecte77/r77-rootkit>

## lolbas

use built-in windows components for persistence (binaries, scripts and libraries)

```
[~]$ exfiltration.c --help
```

```
exfiltration and impact
```

```
    refers to the point at which the opposing team steals information from  
    the network and compromises the availability of the environment.
```

```
data exfiltration via alternative protocols
```

```
data exfiltration through c2
```

```
ransomware development
```

## exfiltration

### dns-exfil

dns server created to exfiltrate data  
<https://github.com/karimpwnz/dns-exfil>

### sharpexfiltrate

uses secure channels as drivers to exfiltrate data  
<https://github.com/flangvik/sharpexfiltrate>

### cobalt strike

create https/dns beacon to exfiltrate data

### malware bazaar

malware samples to analyze or use as a basis for creation.

### RaaSNet

Script that generatesransomwarefor opponent simulation

### programming languages

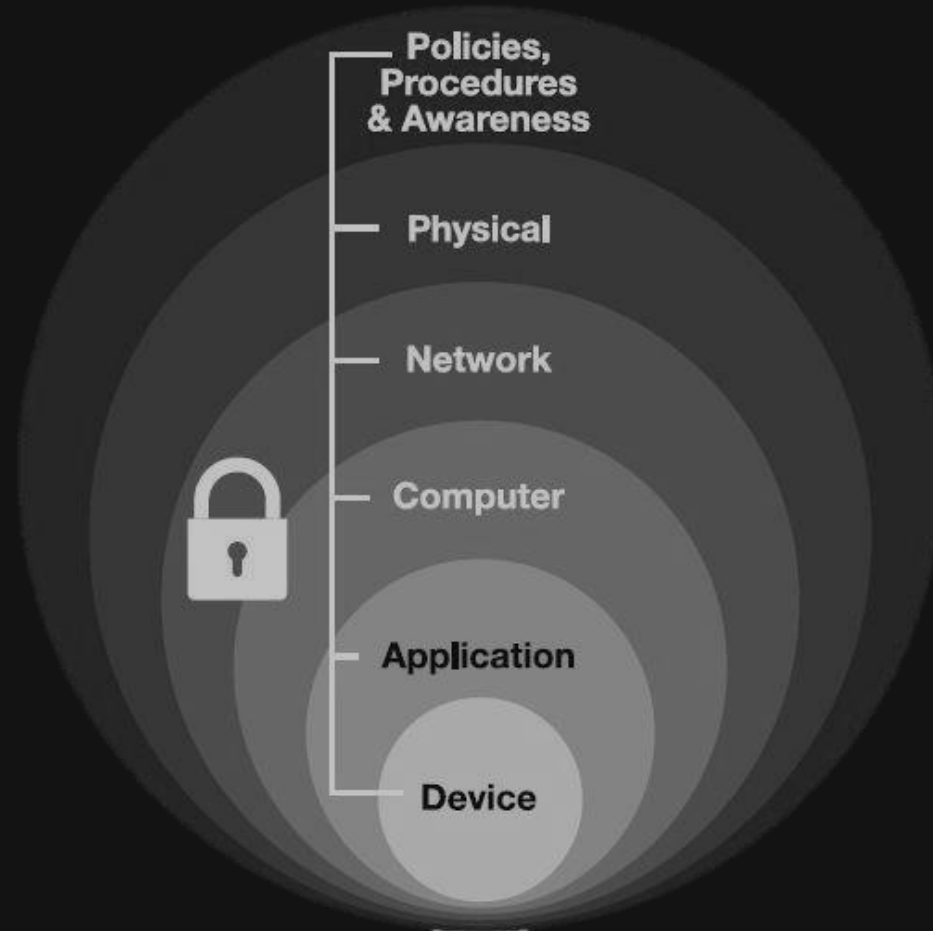

go, c#, c++, python and ruby

prevention methods

# security in depth

# Risk management

risk management is the process of identifying, assessing and mitigating risks that may affect an organization, project, process or activity.

The primary objective of risk management is to take proactive measures to reduce the likelihood of adverse events occurring and to minimize their impact if they do occur.

maturity	in	until	recommendation
insufficient	0.00	3.00	deal with
regular	3.01	5.00	to develop
good	5.01	7.50	to improve
very good	7.51	9.00	improve
great	9.01	10.00	to maintain

# nist-based maturity process

the nist cybersecurity framework (csf) is a set of guidelines and best practices developed by the us national institute of standards and technology (nist) to help organizations manage and improve their cybersecurity posture.

csf offers a flexible, risk-based model that allows organizations to tailor their cybersecurity strategies to their specific needs.

identify	protect	to detect	to respond	to recover
asset Management	access control	anomalies and events	response	recovery
business environment	awareness and training	continuous security monitoring	planning	planning
governance	data security	detection processes	communications	improvements
risk assessment	information protection processes and procedures		analyzes	communications
risk assessment strategy	maintenance		mitigations	
supply chain risk management	protection technology		improvements	

# cybersecurity solutions

*“Facilitate cybersecurity operations and ensure effective controls across your environment.”*

this summarizes cybersecurity solutions and their importance, and cis categorizes at least 18 essential solutions for your security maturity

and thesanmaps the top 20 security controls through existing solutions on the market.

# Future of the cybersecurity market

## Future outlook of cybersecurity market

**\$101.5**

billion in projected spending on service providers' by 2025

**15%**

annual increase of costs related to cybercrime; will reach **\$10.5 trillion** a year in 2025

**85%**

of small and midsize enterprises intend to increase IT security spending until 2023

**3.5**

million cybersecurity positions now open worldwide

**+21%**

forecast of compound annual growth for direct cyber insurance premiums until 2025

<sup>1</sup>Service providers include consultants, hardware support, implementation, and outsourcing.
